

Depression Looks Like Me

Depression & the LGBTQ+ Community

If you're LGBTQ+ and experiencing symptoms of depression, you are NOT alone. Members of the LGBTQ+ community are affected by mental health conditions, including major depressive disorder (MDD) or clinical depression, at higher rates than the general population,¹ which is often due to stigma and discrimination.

By the Numbers

Nearly 60% of LGBTQ+ adults are experiencing mental health challenges today.² In fact, LGBTQ+ adults are **three times as likely** to experience a mental health disorder than individuals who identify as straight.³

The bisexual and transgender communities specifically have the **highest rates** of mental health challenges within the LGBTQ+ population.⁴

Half of all transgender adults who report not feeling supported by their families are currently experiencing serious psychological distress.⁵

An analysis of the recorded deaths by suicide in 18 US states showed that the **largest incidence of suicide** is among middle-aged LGBTQ+ people.⁶

40% of all transgender adults report they have attempted suicide in their lifetime compared to less than 5% of the overall US population.⁵

Do I Have Depression?

Depression is a serious mental illness that can have a significant, negative impact on the way you think, feel and act. Depression symptoms and severity vary by person and may include persistent feelings of sadness, hopelessness or tension; changes in sleep or appetite; difficulty concentrating or performing activities of daily living; lack of interest; and or thoughts of self-harm or suicide.⁷

Living with depression is challenging for anyone. But when you're also facing disparities and hurdles associated with being LGBTQ+, such as rejection, discrimination, and violence, it can add to mental health challenges.

Not All Depression Is the Same

When a person with MDD does not respond adequately to two or more antidepressant medications, they may be considered to have treatment-resistant depression (TRD).⁸ TRD isn't your fault. You haven't failed — it's more common than you think. Approximately 1/3 of people with MDD may have TRD.⁹

Sometimes, symptoms also can progress to a point where a person starts actively considering suicide and requires urgent intervention to treat their symptoms.¹⁰

While these forms of depression can be more persistent, there is still hope. There are treatment options for these ongoing or more severe types of depression.

How Can I Seek Help?

Only 1/3 of those suffering from severe depression seek treatment from a healthcare professional.¹¹

Many don't know what to do when symptoms become more severe. But there are other options and places to turn for help. An important step is finding a healthcare provider that makes you feel safe, supported and heard.

Finding providers with whom you can create a personal connection will establish a safe space and allow you to develop a more personalized approach to your treatment plan.
